

PRODUCT & UX PRESENTATION

Designing the Adbond experience

How the mobile app — and its companion web dashboard — should look, feel, and flow, from first launch to a portfolio the client can watch grow, funded by a payment model built around how Nigerians actually move money.

PREPARED FOR	COVERS	DATE
Product owner & leadership	Mobile app + client web dashboard	12 August 2026

AGENDA

What's covered

01	Executive summary The decisions in one page	02	The product, one loop How money moves through the app
04	The funding model Dedicated accounts, fees, trade-offs	05	Product types Land, Agro, Homes, Bonds, Resale
06	The live catalogue, today Six real projects, fourteen packages	08	From launch to first asset The full flow, mapped
09	Home dashboard, reimagined Eleven requested features	10	The savings layer Goals, growth, and the wallet
11	The Agro experience A founding pillar, designed on purpose	12	Documentation & allocation Making ownership visible
13	Screen map The full information architecture	14	Ready now vs. new to build A scoping reference

01 **Executive summary**

Four decisions run through this whole document. Everything after this page is the detail behind them.

3

Product pillars — Land, Agro, Homes — each with its own flow

1

Dedicated account number per client, replacing card checkout

₦2,000

Capped processing fee, even on a multi-million-naira transfer

11

Dashboard features scoped, most already supported by existing data

PAYMENTS

Move off card-based checkout entirely. Every client gets a dedicated bank account number the moment they sign up; they fund purchases and their wallet by transferring into it directly, the way Nigerians already prefer to move meaningful amounts of money.

WALLET

The wallet becomes a savings destination in its own right — named goals, visible growth, money arriving from referrals and payouts — not just a balance sitting behind a withdraw button.

TRUST

Two features do more for client confidence than any other: an allocation tracker that replaces silence with visible progress after purchase, and a single documents hub for every contract and receipt.

IDENTITY

Agro isn't a filter tab — it's a third of the company's name and deserves its own visual language, not a shared template with Land and Homes.

02 The product, one loop

Before any screen gets designed, it's worth agreeing on the one idea the whole app hangs off: money in Adbond always has a destination it's being pointed toward — owning more property. Everything that earns a client money lands in the same Wallet, and the Wallet itself can be aimed at the next purchase. That closed loop is the mechanism worth designing around.

Two design consequences fall out of this immediately: the Wallet can't be a peripheral "top-up" screen — it deserves the same weight as Portfolio on the home tab bar — and every earning moment in the app (a payout, a commission, a sale) should visibly animate into the Wallet balance.

03 • TURNING POINT

How money actually moves

The single biggest change in this document: checkout stops asking for a card number, and starts with an account number instead.

04 The funding model: dedicated accounts

Card checkout is coming out of the flow entirely. In its place: the moment a client's account is verified, the platform issues them a personal, permanent bank account number. They fund anything — a wallet top-up, a plot, an installment — by transferring into that number from whichever bank they already use.

How it works

1. **One account, issued once.** A dedicated Nigerian account number (a real NUBAN, at a licensed partner bank) is generated per client and never changes — it's tied to their Wallet for life, not to a single order.
2. **Shown wherever money is needed.** On the Wallet screen for a general top-up, and again at checkout with the exact amount pre-filled — same account number both times, the app just knows what to do with the money depending on where the client came from.
3. **Reconciled automatically.** The banking partner notifies Adbond the moment a transfer lands — typically within seconds — and the balance updates without anyone re-checking a bank app or uploading a screenshot.
4. **Evidence upload stays as a fallback** for the rare case where automatic confirmation is delayed, not as the default path.

Choosing a banking partner

This needs a provider that offers a *persistent, one-per-customer* account — not a one-time account generated per transaction, which is a different (and more limited) product. Three were checked against that requirement:

PROVIDER	ACCOUNT TYPE	FEE (PUBLISHED)	READ
Paystack	Dedicated Virtual Account — persistent, one per customer	1.5%, capped at ₦2,000 per transfer	Already integrated today — the lowest-effort switch
Monnify	Reserved Account — persistent, one per customer, never expires	1.5%, capped at ₦2,000, no setup or monthly fee	Purpose-built for exactly this use case
OPay	Virtual account generated per order (dynamic)	Not published for a persistent-account tier	Their documented product fits one-off collection, not a standing personal account — needs direct confirmation from their business team before it's ruled in or out

Recommendation: shortlist Paystack and Monnify, since both clearly offer the persistent-account product this needs, and get it in writing from OPay whether they can match that before including them as an option — not just from what's published.

Upside, for management

- **Matches how people already pay for anything expensive.** Nigerians overwhelmingly prefer bank transfer to card entry once an amount gets serious — cards decline against bank-imposed limits far more often on multi-million-naira purchases, which is exactly Adbond's price range.
- **Card data stops being the app's problem.** No card numbers stored or handled anywhere in the flow, which shrinks the compliance surface and removes chargeback exposure — a bank transfer, once it lands, isn't reversible the way a disputed card payment is.
- **The fee ceiling is already low at this price range.** On the researched pricing, a transfer is capped around ₦2,000 regardless of size — a ₦5,000,000 plot payment and a ₦150,000 installment cost the same processing fee.
- **One account, used forever.** A relative or business partner can pay on a client's behalf without that client navigating a checkout flow at all — just send to the number.

Downside, for management

- **It's one step less "instant" than a card.** A client still leaves the app to their own banking app or dials USSD to send the transfer — that's one more

moment for drop-off than a one-tap card charge.

- **True automatic recurring debit isn't part of this.** A dedicated account only receives money a client actively sends — it can't pull an installment automatically on its due date. A real auto-pay feature needs a separate recurring-mandate product layered in later; until then, "AutoSave" is a reminder-and-manual-transfer flow, not a truly automatic one (see §10).
- **It's a dependency on the banking partner's uptime.** If their confirmation webhook lags, a client's payment can look like it "hasn't arrived" for a stretch — needs a clear in-app "we've received your transfer, confirming now" state so this doesn't become a support-ticket generator.
- **Not every client gets an account instantly.** Regulation requires a BVN and a completed identity-verification tier before an account can be issued, so a small minority of clients may need to finish KYC first.

05

Product types, and how each one works

Five distinct shapes a client's money can take inside the app. The first three are what a client browses; the last two are structures and behaviors layered on top of them.

TYPE	WHAT IT IS	HOW THE FLOW WORKS
Land	Outright plots within an estate or development	Browse by development → choose a unit count (this sets the co-ownership share) → fund by transfer → own outright or on an installment plan → value tracked against the plot's current listed price → exit by holding, or by listing on the resale marketplace
Homes	Completed or in-progress residential units	Same purchase mechanics as Land, but typically sold as a whole unit rather than a fraction of one, and heavier on documentation — the deed of assignment is the headline document here
Agro	Fractional shares in a working farm	Bought as a share of a harvest cycle, almost always co-owned rather than held outright, usually structured as a fixed-term return (see Bonds) tied to the harvest calendar — full treatment in §11
Bonds	Not a separate catalogue — a purchase structure available on Agro and some Land/Homes packages	Capital is locked for a set term, earns a defined return on a defined schedule, counts down to a maturity date, and is then redeemed for cash or renewed for another term
Marketplace resale	A secondary layer that runs across Land, Homes, and non-bond Agro assets	A fully-paid asset is listed → another client bids → the seller accepts → the buyer pays by transfer → ownership moves to the buyer and proceeds land in the seller's Wallet

06

The live catalogue, today

Six projects, fourteen packages, five states — this is what "Product types" (\$05) actually looks like in the market right now, and what the app's data model has to hold cleanly from day one.

PROJECT	STATE	SIZES OFFERED	OUTRIGHT PRICE RANGE	NOTES
Ibadan Country Home	Oyo	150 / 500 / 600sqm	₦415K – ₦2.71M	4 packages — the only project with a premium "C of O in view" tier (Elite Pro)
Legacy Green Homestead	Ogun	150 / 600sqm	₦664K – ₦2.43M	Packages named by buyer persona — "Teenager", "Cooperate"
Motherland Homestead	Ogun	150 / 600sqm	₦253K – ₦682K	"Corper Package" — priced for NYSC corps members, the most affordable project in the set
New Lagos City	Lagos	150 / 500sqm	₦2.19M – ₦7.66M	Highest price-per-sqm of the six — Epe waterfront positioning
My Country Home	Rivers	150 / 600sqm	₦4.05M – ₦7.65M	Different document set and flyer template entirely — see below
Western Country Home	Osun	150 / 600sqm	₦467K – ₦1.87M	Only project naming its landmarks by nature feature (a dam, a mountain)

Full package-by-package pricing, discounts, benefits and required documents are in the companion spreadsheet, *Adbond-Product-Catalogue.xlsx*.

What this means for the app, structurally

- **Every package needs a size tier, not a single size.** All six projects already sell the same package concept at two — sometimes three — sizes. The package model needs "size variant" as first-class, not a one-off field.
- **Packages are already informally segmented by persona.** "Teenager", "Corper", "Cooperate", "Family" — the app's package metadata should carry this as structured data, a target-buyer tag, not leave it buried in a free-text name, since it's a natural filter and recommendation signal.

- **Document sets aren't uniform.** Most packages ship two documents; one ships three; one project ships a completely different four-document set. The Documentation hub (\$12) needs to render whatever document set a package actually has, not assume a fixed list.
- **"Annual Net Rental Income" is promised on 12 of 14 packages with no number attached anywhere.** This is the same appreciation-data gap flagged for Property Appreciation (\$09) — now confirmed against real marketing material, not just the data model. If this is going to be a real figure in the app rather than a bullet point, a rental-yield field needs to exist per package.

07 • WALKTHROUGH

The full journey, start to finish

Every screen that follows exists somewhere on this path — from a cold app launch to a client watching their first asset show up.

08 From launch to first asset

The full path, mapped end to end.

01 Launch

Splash screen carries the brand moment — logo, then straight into the session check above. No loading spinner longer than this.

02 First impression (new clients only)

A short onboarding carousel, one slide per pillar: **Land** (own a plot outright), **Agro** (invest in farmland harvests), **Homes** (buy into developed property). This is the first time the three-pillar identity should appear.

03 Create an account

Email, verify by OTP, basic details, and an optional referral code field — pre-filled automatically if the client arrived via a shared invite link. A soft prompt to add a next-of-kin and start KYC follows, but nothing here blocks reaching the dashboard; KYC becomes a hard gate only at checkout and wallet withdrawal, since it's also what unlocks the dedicated account number.

04 Welcome home

First-ever dashboard view is deliberately different from a returning client's: no portfolio yet, so the space that will later hold "Properties Owned" instead shows a confident call to action — *browse your first project* — plus the referral code, already generated, ready to share.

05 Explore

Projects filtered by pillar (Land / Agro / Homes), each package card showing price, size, and the co-ownership fraction still available ("38 of 50 plots left").

06 Decide

Package detail shows what the client is actually buying into: location, unit price, return data where the package carries it, and photos or a VR tour where available.

07 Checkout

Choose units (this is literally choosing the co-ownership percentage), full payment or an installment plan, apply a promo code. The balance can be part-funded straight from the Wallet if the client has been saving toward this (\$10).

08 Pay by transfer

The app shows the client's dedicated account number with the exact amount due. They transfer from whichever bank they use — their own banking app or USSD — and the balance confirms within moments of the transfer landing. No card is entered anywhere in this flow.

09 It's yours

Confirmation screen, a receipt, and the new asset appears in Portfolio immediately — marked **Pending Allocation** rather than fully "owned" until the physical plot is assigned (\$12). This honesty matters more than a premature celebration.

10 Watch it grow

Over the following weeks: allocation and documentation status update (push notification each time), and if it's a bond-structured package, a maturity countdown and running return figure become visible — payouts land in the Wallet on schedule, closing the loop from \$02.

09 **Home dashboard, reimagined**

The requested feature list, each grounded in what the platform already tracks versus what's genuinely new — so design and engineering are working from the same read of reality.

Properties Owned

READY

A visual portfolio grid — every plot, farm share, or unit the client holds, each card showing a photo, location, and current status at a glance.

How: the platform already keeps a per-client asset list with totals pre-computed; this is a UI build against existing data.

Co-ownership Percentage

READY

"You own 3 of 50 plots — 6% of this development," shown on every shared-package asset, not just Agro.

How: every package already tracks total units against units sold; the client's own share divides cleanly out of that. Pure presentation work.

Payment Progress

READY

A progress bar per asset — amount paid vs. total price, installments completed vs. total, and the next amount due.

How: every order already tracks amount paid, balance, and installment counts. Needs a progress-ring or bar component, not new data.

Allocation Status

NEW

A simple stepper — *Subscribed* → *Documentation in progress* → *Plot Allocated* → *Title Perfected* — so a client isn't left wondering what "owned" actually means yet.

How: the concept of a formally assigned plot doesn't exist as a tracked status today. Needs a new status field on each asset, updated by staff as the physical/legal steps complete. Detailed in §12.

Documentation

MOSTLY READY

One place to view and download every legal document tied to an asset — contract, letter of happiness, deed of assignment, receipts.

How: these documents already exist and are generated automatically; they're just not aggregated in one client-facing view yet. Detailed in §12.

Property Appreciation

MOSTLY READY

"This asset has grown 12% since purchase" — shown as a simple trend, not a stock-ticker.

How: fully modeled already for bond-structured assets (a return rate and timeline are stored per bond). For a straight land/home purchase, it's inferred by comparing today's listed price to the client's locked-in price — accurate, but a proper historical chart needs a new price-log kept over time.

Referral Earnings

READY

Total earned from referrals, broken down by who was referred and what they've earned so far — plus one tap to reshare the invite code.

How: referral tracking and commission calculation already exist end to end. This is a UI and share-flow build.

Portfolio Value

READY

One headline number on the home tab: total current value of everything owned, plus what was actually paid for it, side by side.

How: the platform already computes both current worth and original purchase cost per client behind the scenes. Needs a hero stat treatment on the dashboard, no new data work.

Upcoming Payments

READY

A simple "due soon" list across every active installment plan, with a reminder before the due date and a clear grace-period warning if one's been missed.

How: due dates and grace periods are already tracked per order. A per-installment calendar (rather than just a running balance) is a small enhancement worth doing alongside this.

Customer Support

NEW

An in-app Support Center: searchable FAQ, one-tap WhatsApp/call/email, and a running list of anything the client has raised with staff.

How: the company's contact details are already centrally stored, so "talk to us" is a quick win. A proper ticket history or live-chat layer is net-new and belongs on the phase-2 roadmap.

10 The savings layer

The instinct behind the request to make the wallet feel more like a savings app is right: named goals, visible growth, a balance that climbs while a client watches, are what make saving feel active instead of passive. Adbond already has the underlying plumbing — a balance, a reserved amount, a full transaction ledger — to build that entire language in its own voice.

Flex Balance — what exists today

The client's spendable Wallet balance — referral commissions, bond payouts, and resale proceeds land here automatically, and it's topped up directly by transferring into the dedicated account number from \$04. Already fully working; needs visual confidence — a big, warm balance figure, a satisfying moment the instant new money arrives — rather than a plain number in a list.

Save to Own a Plot NEW — A GOAL-BASED POCKET

A client picks a specific package as a goal — say, a ₦4.5M plot — and sets a savings target. A progress ring shows saved-vs-target as they transfer money in over time. On reaching the goal, the balance is offered straight into checkout for that package as either a deposit or full payment. Recurring, hands-off top-ups are a natural next step here, but depend on the recurring-mandate product flagged as a downside in \$04 — until that exists, this is a reminder-and-manual-transfer experience, well-designed rather than fully automatic.

Bonds, visibly growing — data ready, needs the visual

A bond-structured asset already behaves like a locked, fixed-return savings product: capital is locked for a term, it accrues a defined return on a defined schedule, and there's a maturity date after which the client can redeem or roll it over. It just isn't presented that way yet. A countdown ring to maturity, a capital figure that visibly ticks upward, and the redeem/renew choice framed as a clear "cash out or let it ride" decision would do this justice.

Invite & Earn — data ready, needs the visual

Referral commissions already exist end-to-end (\$09). The invite flow deserves the same energy as the rest of this section: a shareable code and link, a running "you've earned ₦X from Y referrals" counter, and the earning landing in the Flex Balance with the same animated moment as any other inflow.

Withdraw — what exists today

PIN-gated, and every withdrawal is a request that staff approve before funds actually move — already a safer pattern than an instant transfer, and worth keeping exactly as-is.

DESIGN NOTE

Don't let the savings-app polish blur the one real difference between this and a general savings app: the goal here is a title deed, not cash back with interest. Every "Save to Own" screen should end its copy pointing at the plot, not just the number — that's the thing actually being sold.

11 The Agro experience

Agriculture isn't a side category bolted onto a land-investment app — it's one of the platform's three founding pillars, and "Harvest" is half the company's name. It deserves its own visual language inside the app, not a filter tab.

- **A distinct home within Invest.** Land, Agro, and Homes should read as three genuinely different shopping experiences, not one catalog with a category dropdown — different imagery language (farmland, not architectural renders), different vocabulary (harvest cycle, not floor plan).
- **Harvest-cycle timeline.** Where a Land plot's story is "own it, watch its value move," an Agro share's story is seasonal: planting, growing, harvest, payout. A simple horizontal timeline component showing where the current cycle stands communicates that instantly.
- **Return, framed as yield.** Agro packages structured as bonds already carry a defined return rate and payout schedule — the same data behind \$10's growth treatment. For Agro specifically, frame it as expected *yield* rather than generic "return," matching how a farming outcome is actually talked about.
- **Shared-farm co-ownership.** This is where "co-ownership percentage" (\$09) matters most — most clients will hold a fraction of a shared farm, not a whole one, so the co-ownership framing should feel native here, not like a caveat.

WHAT'S NEW TO BUILD

The Agro category and its return structure already exist in the platform. What's missing is the presentation layer described above, plus lightweight new metadata per Agro package — crop type, planting date, expected harvest window — to actually populate the timeline.

12 Documentation & allocation, made visible

These two features are really about the same thing: trust. A client who has paid in full but can't see proof of what they own, or where it stands, is a client who calls support. Both deserve dedicated, honest screens rather than being buried inside an asset's detail page.

My Documents

One tab, every legal document across every asset: sale contract, letter of happiness, memorandum of agreement (or, for bonds, the participation agreement), deed of assignment, and every payment receipt — each downloadable and shareable as a PDF. The company already generates all of these automatically the moment they're due; they simply live scattered across different records today rather than in one client-facing hub.

Allocation Tracker

A plain-language status stepper on every asset: *Subscribed* → *Documentation in progress* → *Plot Allocated* → *Title Perfected*. Each step change should fire a push notification — this single feature does more for perceived trust after a purchase than almost anything else on this list, because it replaces silence with visible progress.

WHAT'S NEW TO BUILD

Allocation as a tracked status doesn't exist in the platform yet — today, a plot purchase and a plot allocation are the same event. This needs a new status field per asset that staff update as the real-world allocation and documentation steps complete, which is also what powers the Allocation Tracker's notifications.

13 Screen map

The full information architecture, folding in every feature above. New screens are marked.

AREA	SCREENS	
Onboarding	Splash → 3-slide pillar intro (Land / Agro / Homes) → Login / Register → Email OTP	
Home	Portfolio value hero, properties-owned carousel, upcoming payments, referral snapshot, recent activity	
Invest	Pillar-first browse (Land / Agro / Homes) → Project → Package (co-ownership, return data) → Checkout → Pay by transfer	TRANSFER CHECKOUT
Portfolio	Asset grid → Asset detail (payment progress, allocation tracker, appreciation, documents) → Bonds (growth view) → Redeem/Renew	+ ALLOCATION TRACKER
Documents	All documents, grouped by asset, filter by type	NEW TAB
Wallet	Flex Balance → Dedicated account number (fund by transfer) → Save to Own (goals) → Transactions → Link bank for withdrawals → Withdraw	DEDICATED ACCOUNT
Marketplace	Browse offers → Offer detail / bid → My offers → My bids → Pay by transfer	
Referrals	My code + share sheet → Referred clients → Earnings	
Site tours	Schedule list/filter → Book → My bookings	
Community	Feed → Post detail → Comment/react	
Support	FAQ search → Contact us (call/WhatsApp/email) → My requests	NEW TAB
Profile	View/edit profile, KYC, next of kin, settings	

14

Ready now vs. new to build

A quick-reference summary for scoping conversations.

FEATURE	STATUS	WHAT'S ACTUALLY NEEDED
Properties owned	READY	UI build against existing data
Co-ownership %	READY	UI build — the math already exists
Payment progress	READY	UI build against existing data
Portfolio value	READY	UI build against existing data
Upcoming payments	READY	UI build, plus a nicer per-installment calendar
Referral earnings	READY	UI + share-flow build
Documentation	MOSTLY READY	New aggregation view pulling existing documents into one place
Appreciation info	MOSTLY READY	Ready for bonds; a price-history log for direct purchases
Agro experience	MOSTLY READY	New presentation layer + crop/harvest metadata
Allocation status	NEW	New status field and staff workflow
Dedicated account funding	NEW	Banking-partner integration (\$04), replacing card checkout
Save to Own goals	NEW	New goal-savings feature
Recurring auto-debit	NEW	Separate mandate product — phase 2, not part of the account switch
Customer support	NEW	Contact routing is ready now; ticketing/live chat is net-new

Written for product and design planning. Grounded in a direct read of the Adbond platform's data model and current, published pricing from the banking partners named in §04 — what's marked "Ready" is backed by fields and views that exist today, not assumptions. The technical companion — full API surface, authentication flow, and backend gaps — is available separately as the engineering brief.

17 / 17

Owning more, made visible at every step.

Four decisions, five product types, one loop that always points back to property. Ready for design and engineering to take it from here.
